## Agenda

- Introduction
- Generic Troubleshooting Methodology
- BGP Peering Issues
- Best Path calculation, Convergence
- Missing Routes, Unexpected Routes, Filtering and Stale Routes
- Troubleshooting with BGP Table
   Version , Route Churn
- Troubleshooting with NX-OS
- BGP and Automation
- Conclusion
   ciscolive;

# Generic Troubleshooting Methodology (Techniques)

Few Basic Things

- Define the problem
- Narrow down the problem
  - Can you reproduce it?
  - Which device(s) are the cause of the problem?
  - Verify relevant configuration pieces
- Troubleshoot one thing at a time
  - 20k routes flapping? Pick one route and focus on that one route
- Have a co-worker take a look
  - · Forces you to talk through the problem
  - Different set of eyes may spot something
- Packet capture tools
  - Platform based / SPAN

#### NTP, Syslog, Tacacs

- Use NTP to sync timestamps on your routers
  - clock timezone EST -5 0
  - clock summer-time EDT recurring
  - ntp server x.x.x.x
- Use a Syslog Server
  - logging buffered {informational | debugging}
  - logging host x.x.x.x
  - service timestamps log datetime msec localtime
- Tacacs Logs
  - Viewing Commands executed during / before the problem
  - Use show accounting logs (on NX-OS)

Define the baseline...

- "The CPU on this router is high"
  - · High compared to what?
  - · What is the CPU load normally at this time of day?
- · Things to keep track of
  - CPU load
  - Free Memory
  - Largest block of memory
  - Input/Output load for interfaces
  - Rate of BGP bestpath changes
  - Etc., etc.

#### Packet Capture Tools

- IOS / IOS XE
  - ✓ Embedded Packet Capture
- 6500 / 7600
  - ✓ ELAM
  - ✓ NETDR Capture
  - MPA (Mini Protocol Analyzer)
- ASR9000
  - ✓ Network Processor Capture
- Nexus (9k, 7k, 5k, 3k)
  - ✓ Ethanalyzer
  - ✓ Elam

#### Sniffer Captures – Last Resort

- Use SPAN to get traffic to your sniffer
  - monitor session 1 source interface Te2/4 rx
  - monitor session 1 destination interface Te2/2
- IOS-XR
  - Only supported on ASR-9000
  - Use ACLs to control what packets to SPAN
- RSPAN
  - "RSPAN has all the features of SPAN, plus support for source ports and destination ports that are distributed across multiple switches, allowing one to monitor any destination port located on the RSPAN VLAN. Hence, one can monitor the traffic on one switch using a device on another switch."

# Troubleshooting BGP Peering Issues, Session Flaps

#### Preliminary checks

- Verify Configuration
  - ✓ Peering IP Address
  - ✓ AS Number
  - ✓ MD5 Authentication (Optional)
  - ebgp-multihop hop-count (eBGP only)
- Verify Reachability
  - ✓ ping remote-ip source source-ip
  - If reachability issues found:
    - ✓ Use **traceroute** to verify where the trace is dropping

R1	R2 R3	
	router bgp 65000	
	bgp router-id 192.168.2.2	
	bgp log-neighbor-changes	
	neighbor 192.168.1.1 remote-as 65000	
	neighbor 192.168.1.1 update-sour lo0	
	neighbor 192.168.3.3 remote-as 65535	
	neighbor 192.168.3.3 password C!sc0	
nning	neighbor 192.168.3.3 ebgp-multi 2	
pping		

ebgp-multihop and disable-connected-check

- BGP uses a TTL of 1 for eBGP peers
  - Also verifies if NEXTHOP is directly connected

- For eBGP peers that are more than 1 hop away a larger TTL must be used
  - No longer verifies if NEXTHOP is directly connected
- Use neighbor disable-connected-check
- Disables the "is the NEXTHOP on a connected subnet" check

```
router bgp 65534
neighbor 192.168.3.3 remote-as 65535
neighbor 192.168.3.3 disable-connected-check
```

#### BGP Peering Issues Blocking ACLs

Verify any Firewall / ACLs in the path for TCP port 179

```
R1#telnet 2.2.2.2 179 /source-interface loopback 0
Trying 2.2.2.2 ...
% Destination unreachable; gateway or host down
```

- Ensure BGP Pass-Through configured
  - · ASA / PIX offsets TCP sequence number with a random number for every TCP session
    - Causes MD5 authentication to fail
    - ASA strips off TCP option 19
  - 1. Create ACL to permit BGP traffic
  - 2. Create TCP Map to allow TCP option 19
- 3. Create class-map to match BGP traffic
- 4. Disable sequence number randomization and Enable TCP option 19 in global policy

#### BGP Pass-Through – ASA FW Configuration

```
access-list OUT extended permit tcp host 10.1.12.1 host 10.1.12.2 eq bgp
access-list OUT extended permit tcp host 10.1.12.2 eg bgp host 10.1.12.2
access-list BGP-TRAFFIC extended permit tcp host 10.1.110.2 host 10.1.110.10 eq bgp
access-list BGP-TRAFFIC extended permit tcp host 10.1.110.2 eq bqp host 10.1.110.10
tcp-map TCP-OPTION-19
tcp-options range 19 19 allow
access-group OUT in interface Outside
class-map BGP_TRAFFIC
match access-list BGP-TRAFFIC
policy-map global_policy
 class BGP TRAFFIC
  set connection random-sequence-number disable
  set connection advanced-options TCP-OPTION-19
```

#### BGP Peering Issues BGP Across NAT

- NAT Translation 10.1.12.1 translated to 10.1.23.3
- BGP Peering between R1 and R2
- What will be the neighbor IP configured-
  - On R1?
  - On R2?

#### **Notifications**

#### R2# \*Mar 24 20:25:47.262: %BGP-5-ADJCHANGE: neighbor 1.1.1.1 Down BGP Notification sent \*Mar 24 20:25:47.262: %BGP-3-NOTIFICATION: sent to neighbor 1.1.1.1 **4/0** (hold time expired) 0 bytes

- BGP NOTIFICATIONs consist of an error code, sub-code and data
  - All Error Codes and Sub-codes can be found here
    - http://www.iana.org/assignments/bgp-parameters/bgp-parameters.xml
    - http://tinyurl.com/bgp-notification-codes
  - Data portion may contain what triggered the notification
    - Example: corrupt part of the UPDATE

19 21 2174390 10 1 12 2	10 1 12 1	TCP	60 24754-179 [ACK] Seg-1 Ack-1 Win-16384 Len-0

Ciscolive!

#### Notifications Contd...

Value	Name	Reference
1	Message Header Error	RFC 4271
2	OPEN Message Error	RFC 4271
3	UPDATE Message Error	RFC 4271
4	Hold Timer Expired	RFC 4271
5	Finite State Machine Error	RFC 4271
6	Cease	RFC 4271

The first 2 in "2/2" is the Error Code....so "OPEN Message Error"

### Notifications Contd...

Subcode #	Subcode Name	Subcode Description
1	Unsupported BGP version	The version of BGP the peer is running isn't compatible with the local version of BGP
2	Bad Peer AS	The AS this peer is locally configured for doesn't match the AS the peer is advertising
3	Bad BGP Identifier	The BGP router ID is the same as the local BGP router ID
4	Unsupported Optional Parameter	There is an option in the packet which the local BGP speaker doesn't recognize
6	Unacceptable Hold Time	The remote BGP peer has requested a BGP hold time which is not allowed (too low)
7	Unsupported Capability	The peer has asked for support for a feature which the local router does not support

OPEN Message Subcodes shown above The second 2 in "2/2" is the Error Subcode....so "Bad Peer AS"

#### Problem with TCP Process (show tcp brief)

0 <b>x</b> 4827755c	0	0	0.0.0.179	0.0.0:0	LISTEN
0x48290da8	0	0	12.26.28.152:23	223.255.254.249:4887	7 ESTAB
0x48276c50	0	0	0.0.0:23	0.0.0:0	LISTEN
0x48277ea4	0	0	:::179	:::0	LISTEN
PCB	Recv-Q Ser	nd-Q	Local Address	Foreign Address	State

- PCB is the internal identifier used by TCP. It can be used as input to other show commands.
- Recv-Q shows how much received data is waiting to be "read" from TCP by application.
- Send-Q shows how much application data is waiting to be "sent" by TCP.
- Local-address and foreign address identify the two end points of the connection.
- State identifies the current state of the connection.

#### BGP Peering Issues Most Common TCP States

- LISTEN
  - A listen socket on which incoming connections will be accepted.
- ESTAB
  - An established connection
- CLOSED
  - Socket not fully programmed most often seen on standby RP by applications that are warm or hot standby.

#### Connections that are getting established:

- SYNSENT
  - A SYN message was sent to peer.
- SYNRCVD
  - A SYN message was received from peer socket will move into ESTAB state.

#### Connections that are getting terminated:

CLOSEWAIT, CLOSING, LASTACK, TIMEWAIT, FINWAIT1, FINWAIT2

Detailed info about a TCP Socket

#### XR# show tcp detail pcb 0x48277a58

Connection state is ESTAB, I/O status: 0, socket status: 0 PCB 0x48277a58, vrfid 0x6000000, Pak Prio: Unspecified, TOS: 16, TTL: 255 Local host: 12.26.28.152, Local port: 179 (Local App PID: 180393) Foreign host: 223.255.254.249, Foreign port: 49017 Current send queue size in bytes: 0 (max 16384) Current receive queue size in bytes: 0 (max 16384) mis-ordered: 0 bytes Current receive queue size in packets: 0 (max 50)

- **Pak Prio**: Did the application mark the packet with correct priority? Determines the queuing within the router before it goes out on the wire.
- **TOS**: Type of service, goes out on the wire.
- TTL: Important for eBGP for the TTL security check
- Mis-ordered: How much of the received data is out-of-order?
- Receive queue in packets: how many packets are sitting in receive buffers?

#### Malformed Update

- What if a peer sends you a message that causes us to send a NOTIFICATION?
  - Corrupt UPDATE
  - Bad OPEN message, etc.
- View the message that triggered the NOTIFICATION

show ip bgp neighbor 1.1.1.1 | begin Last reset

Last reset 5d12h, due to BGP Notification sent, invalid or corrupt AS path

Message received that caused BGP to send a Notification:

FFFFFFFFFFFFFFFFFFFFFFFFFFFF005C020000004140010100400206065D1CFC059F400304D58C20F48004040000050540050400000055C0081C329C4844329C6E28329C6E2958F5008258F5EACE58F5FA0258F5FA6E18D14E70

http://bgpaste.convergence.cx/

**Unsupported Capability** 

\*Jan 5 18:18:04.667: %BGP-3-NOTIFICATION: sent to neighbor 10.1.12.1 active 2/7 (unsupported/disjoint capability) 0 bytes R2# \*Jan 5 18:18:04.671: %BGP-4-MSGDUMP: unsupported or malformatted message received from 10.1.12.1: FFFF FFFF FFFF FFFF FFFF FFFF FFFF fFFF 002D 0104 0064 00B4 0101 0101 1002 0601 0400 0100 0102 0280 0002 0202 00

- Disable capability negotiation during session establishment process using the below hidden command **neighbor x.x.x.x dont-capability-negotiate** 

#### **Peering Issues**

#### Stable BGP peers going into Idle State

- BGP Peering has been up for months, but all of a sudden, BGP session goes down and never comes back up
- IGP goes down as well? Yes
- Debug shows keepalives are getting generated
- Check for the Interface Queue on both sides
  - Interface Queue (both input and output queue) getting wedge can cause this symptom
    - Temporary workarounds Increase the Queue size, RP Switchover
    - If its input queue wedge, check the **show buffer input-interface** *x*/*y* **packet** to analyze what packets are stuck in queue. Also checking for incoming traffic rate
    - If its output queue, check for outgoing traffic rate. Check the transmission side

```
R2#show interface gi0/1 | in queue
Input queue: 0/375/0/0 (size/max/drops/flushes); Total output drops: 0
Output queue: 1001/1000 (size/max)
```

Notifications – Hold Time Expired

%BGP-5-ADJCHANGE: neighbor 2.2.2.2 Down BGP Notification sent %BGP-3-NOTIFICATION: sent to neighbor 2.2.2.2 4/0 (hold time expired)

R1#show ip bgp neighbor 2.2.2.2 | include last reset Last reset 00:01:02, due to BGP Notification sent, hold time expired

- R1 sends hold time expired NOTIFICATION to R2
  - R1 did not receive a KA from R2 for holdtime seconds
- One of two issues
  - R2 is not generating keepalives
  - R2 is generating keepalives but R1 is not receiving them

#### Notifications - Hold Time Expired

- · Check if R2 is building keepalives (KA)
  - Check for output drops on R2 outgoing interface
  - When did R2 last build a BGP message for R1. (Should be within "keepalive interval" seconds

```
R2#show ip bgp neighbors 1.1.1.1
Last read 00:00:15, last write 00:00:44, hold time is 180,
keepalive interval is 60 seconds
```

- R2 is building messages for R1 but possibly R2 is unable to send them
  - Check OutQ and MsgSent Counters show bgp afi safi summary
  - OutQ is the number of packets waiting for TCP to Tx to a peer
  - MsgSent is the number of packets TCP has removed from OutQ and transmitted for a peer

#### Notifications – Hold Time Expired

OutQ is incrementing due to keepalive generation MsgSent is not incrementing Something is "stuck" on the OutQ The keepalives are not leaving R2!!

## **Randomly Flapping Peers**

Flapping continuously but not at regular intervals...

- What if the BGP peer is flapping continuously, but not at regular intervals.
  - Sometimes it flaps every 2 minutes and sometimes it flaps after 5 minutes

R2# <b>show ip</b>	bgp	sum   be	gin Neigh	bor				
Neighbor		MsgRcvd 1	MsgSent	TblVer	InQ	OutQ	Up/Down	State/PfxRcd
10.1.13.3		160	284	10167	0	0	00:01:20	10

R2# <b>show ip</b>	bgp	sum   begi	n Neigh	bor				
Neighbor		MsgRcvd Ms	gSent	TblVer	InQ (	DutQ	Up/Down	State/PfxRcd
10.1.13.3		165	296	10167	0	0	00:00:39	10

- Most probable cause could be keepalives are not getting generated in timely manner
- Or, they are not being forwarded out in a timely manner

# Randomly Flapping Peers

ASR1k – EPC Capture and Debugs

### Flapping BGP Peers

**Regular Interval Flaps** 

\*Jun 22 15:16:23.033: %BGP-3-NOTIFICATION: received from neighbor 192.168.2.2 4/0 (hold time expired) 0 bytes

\*Jun 22 15:16:23.033: %BGP-5-ADJCHANGE: neighbor 192.168.2.2 Down BGP Notification received

\*Jun 22 15:16:55.621: %BGP-5-ADJCHANGE: neighbor 192.168.2.2 Up

\*Jun 22 15:19:56.409: %BGP-3-NOTIFICATION: received from neighbor 192.168.2.2 4/0 (hold time expired) 0 bytes

\*Jun 22 15:19:56.409: %BGP-5-ADJCHANGE: neighbor 192.168.2.2 Down BGP Notification received

\*Jun 22 15:20:13.361: %BGP-5-ADJCHANGE: neighbor 192.168.2.2 Up

#### BGP Update Role of TCP MSS

TCP MSS (max segment size) is also a factor in convergence times. The larger the MSS the fewer TCP packets it takes to transport the BGP updates. Fewer packets means less overhead and faster convergence.

![](_page_34_Figure_2.jpeg)

The entire BGP update can fit in one TCP packet

![](_page_35_Figure_0.jpeg)
# Flapping BGP Peers

Path MTU Discovery

- R1 sends a packet with packet size of outgoing interface MTU and DF-bit set
- Intermittent device who has lower MTU has two options
  - Fragment and send the packets (if DF-bit not set)
  - Drop the packet and send ICMP error message Type 3 Code 4
- ICMP error message also have the MTU details in the Next-Hop MTU field
- Source on receiving the message, sends the packet with mentioned MTU.

Type 3 – Destination Unreachable Code 4 – Fragmentation needed and DF-bit set

# Flapping BGP Peers

#### Notifications – Hold Time Expired

- MSS ping
  - BGP OPENs and Keepalives are small
  - UPDATEs can be much larger
  - Maybe small packets work but larger packets do not?

```
R1#ping 192.168.2.2 source loop0
Type escape sequence to abort.
Sending 5, 100-byte ICMP Echos to 192.168.2.2, timeout is 2 seconds:
!!!!!
Success rate is 100 percent (5/5), round-trip min/avg/max = 16/21/24 ms
R1#ping 192.168.2.2 source loop0 size 1500 df-bit
Type escape sequence to abort.
Sending 5, 1500-byte ICMP Echos to 192.168.2.2, timeout is 2 seconds:
Packet sent with the DF bit set
....
Success rate is 100 percent (5/5), round-trip min/avg/max = 1/1/1 ms
```

# BGP BestPath and BGP Convergence

### Path Selection Algorithm

- Quick bestpath review
- Remember
  - BGP only advertises one path per prefix...the bestpath
  - · Cannot advertise path from one iBGP peer to another
- Bestpath selection process is a little lengthy
  - First eliminate paths that are ineligible for bestpath

1	Not synchronized	Only happens if "sync" is configured AND the route isn't in your IGP
2	Inaccessible NEXTHOP	IGP does not have a route to the BGP NEXTHOP
3	Received-only paths	Happens if "soft-reconfig inbound" is applied. A path will be received-only if it was denied/modified by inbound policy.

Inaccessible Next-Hop

- If a BGP route does not have a valid next hop, then it will not be installed in the RIB
- Use show bgp afi safi <prefix> to verify the prefix and the NH

BGP routing table entry for 192.168.1.0/24 Versions: Process bRIB/RIB SendTbIVer Speaker 2929 2929 Paths: (1 available, no best path) Not advertised to any peer Received by speaker 0 Local **10.0.200.1 (inaccessible)** from 10.0.101.2 (10.0.101.2) Origin IGP, localpref 100, valid, confed-internal

#### Path Selection Algorithm

1	Weight	Highest wins	Scope is router only
2	LOCAL_PREFERENCE	Highest wins	Scope is AS only
3	Locally Originated		Redistribution or network statement favored over aggregate-address
4	AS_PATH	Shortest wins	Skipped if "bgp bestpath as-path ignore" configured AS_SET counts as 1 CONFED parts do not count
5	ORIGIN	Lowest wins	IGP < EGP < Incomplete
6	MED	Lowest wins	MEDs are compared only if the first AS in the AS_SEQUENCE is the same
7	eBGP over iBGP		
8	Metric to Next Hop	Lowest wins	IGP cost to the BGP NEXTHOP
9	Multiple Paths in RIB		Flag path as "multipath" is max-paths is configured
10	Oldest External Wins		Unless BGP best path compare router-id configured
11	BGP Router ID	Lowest	
12	CLUSTER_LIST	Smallest	Shorter CLUSTER_LIST wins
13	Neighbor Address	Lowest	Lowest neighbor address

 Path #2: Received by speaker 0
 200, (Received from a RR-client)
    192.168.3.3 (metric 2) from 192.168.3.3 (192.168.3.3)
     Origin IGP, metric 0, localpref 100, valid, internal
     Received Path ID 0, Local Path ID 0, version 0
      Higher router ID than best path (path #1)
```

# Convergence

### Symptoms

- · BGP Table is getting updated slowly
- Traffic loss (Traffic Black-Hole) is experienced

- Two general convergence situations
  - Initial startup
  - Periodic route changes

## Convergence Initial Startup

- Initial convergence happens when:
  - A router boots
  - RP failover
  - clear ip bgp \*
- How long initial convergence takes is a factor of the amount of work to be done and the router/network's ability to do this fast and efficiently

## Convergence Initial Startup

Initial convergence can be stressful...if you are approaching BGP scalability limits this is when you will see issues.

## Convergence Initial Startup

What work needs to be done?

- 1) Accept routes from all peers
  - Not too difficult
- 2) Calculate bestpaths
  - This is easy
- 3) Install bestpaths in the RIB
  - Also fairly easy
- 4) Advertise bestpaths to all peers
  - This can be difficult and may take several minutes depending on the following variables...

# Convergence

**Dimensional Factors** 

- Number of peers
- Number of address-families
- Number of path/prefix per address-family
- · Link speed of individual interface, individual peer
- Different update group settings and topology
- Complexity of attribute creation / parsing for each address-family

## Convergence UPDATE Packing

- An UPDATE contains a set of Attributes and a list of prefixes (NLRI)
  - BGP starts an UPDATE by building an attribute set
  - BGP then packs as many destinations (NLRIs) as it can into the UPDATE

NLRI = Network Layer Reachability Information

Only NLRI with a matching attribute set can be placed in the UPDATE

NLRI are added to the UPDATE until it is full (4096 bytes max)

Least Efficient	MED 50 Origin IGP	10.1.1.0/24	MED 50 Origin IGP	10.1.2.0/24	MED 50 Origin IGP	10.1.3.0/24
Most Efficient	MED 50 Origin IGP	10.1.1.0/24 10.1.2.0/24 10.1.3.0/24				

## Convergence UPDATE Packing

- The fewer attribute sets you have the better
  - More NLRI will share an attribute set
  - Fewer UPDATEs to converge
- Things you can do to reduce attribute sets
  - next-hop-self for all iBGP sessions
  - Don't accept/send communities you don't need
  - · Use cluster-id to put RRs in the same POP in a cluster
- To see how many attribute sets you have

#### show ip bgp summary

190844 network entries using 21565372 bytes of memory 302705 path entries using 15740660 bytes of memory 57469/31045 BGP path/bestpath attribute entries using 6206652 bytes of memory

# Update Group on RR

- Update groups are very usefull on all BGP speakers
  - but mostly on RR due to
    - Number of peers
    - Same outbound policy
      - IBGP peers typically do not have any outbound policies

#### 

```
Update messages formatted 239, replicated 24210, current 0, refresh 0, limit 2000
```

Number of NLRIs in the update sent: max 812, min 0 Minimum time between advertisement runs is 0 seconds

#### Has 101 members:

10.1.1.2	10.2.1.1	10.2.1.10	10.2.1.100
10.2.1.11	10.2.1.12	10.2.1.13	10.2.1.14

• • •

# Troubleshooting BGP Convergence

### Update Groups on IOS XR

- IOS XR have hierarchical update groups
- Sub-Groups are subset of neighbors within an update Group
  - Neighbors running at same pace
- Even a newly configured neighbor is put in a separate sub-group till it reaches the same table version as other members

# Troubleshooting BGP Convergence

### Update Groups on IOS XR

# Convergence

### **Dropping TCP Acks**

- Primarily an issue on RRs (Route Reflectors) with
  - · One or two interfaces connecting to the core
  - Hundreds of RRCs (Route Reflector Clients)
- RR sends out tons of UPDATES to RRCs
- RRCs send TCP ACKs
- RR core facing interface(s) receive huge wave of TCP ACKs

## Convergence Nexthop Tracking – NHT

- BGP nexthop tracking
  - Relies on ATF
  - Event driven convergence model
- Register NEXTHOPs with ATF
  - 10.1.1.3
  - 10.1.1.5
- ATF filters out changes for 10.1.1.1/32, 10.1.1.2/32, and 10.1.1.4/32
  - BGP has not registered for these
- Changes to 10.1.1.3/32 and 10.1.1.5/32 are passed along to BGP
  - · Recompute bestpath for prefixes that use these NEXTHOPs
  - No need to wait for BGP Scanner

## Convergence Nexthop Tracking

- · Enabled by default
  - [no] bgp nexthop trigger enable
- BGP registers all nexthops with ATF
  - show ip bgp attr next-hop ribfilter
- Trigger delay is configurable
  - bgp nexthop trigger delay <0-100>
  - 5 seconds by default
- Debugs
  - debug ip bgp events nexthop
  - debug ip bgp rib-filter

# Convergence

#### MRAI (Minimum Route Advertisement Interval)

- How is the timer enforced for peer X?
  - Timer starts when all routes have been advertised to X
  - For the next MRAI (seconds) we will not propagate any bestpath changes to peer X
  - Once X's MRAI timer expires, send him updates and withdraws
  - Restart the timer and the process repeats...
- User may see a wave of updates and withdraws to peer X every MRAI seconds
- User will NOT see a delay of MRAI between each individual update and/or withdraw
  - · BGP would never converge if this were the case

## Convergence MRAI

- MRAI timeline for BGP peer w/ MRAI of 5 seconds
- T0
  - The big bang  $\odot$
- T7
  - Bestpath Change #1
  - UPDATE sent immediately
  - MRAI timer starts, will expire at T12
- T10
  - Bestpath Change #2
  - Must wait until T12 for MRAI to expire
- T12
  - MRAI expires
  - Bestpath Change #2 is Txed
  - MRAI timer starts, will expire at T17
- T17
  - MRAI expires
  - No pending UPDATEs

## Convergence MRAI

- BGP is not a link state protocol, it is path vector
- May take several "rounds/cycles" of exchanging updates and withdraws for the network to converge
- MRAI must expire between each round!
- The more fully meshed the network and the more tiers of ASes, the more rounds required for convergence
- Think about
  - How many tiers of ASes there are in the Internet
  - How meshy peering can be in the Internet

## Convergence MRAI

- Internet churn means we are constantly setting and waiting on MRAI timers
  - One flapping prefix slows convergence for all prefixes
  - · Internet table sees roughly 6 bestpath changes per second
- For iBGP and PE-CE eBGP peers
  - neighbor x.x.x.x advertisement-interval 0
  - Has been the default since 12.0(32)S
- For regular eBGP peers
  - Default is 30 seconds
  - Lowering to 0 may get you dampened
  - · OK to lower for eBGP peers if they are not using dampening

# Troubleshooting BGP Convergence – IOS XR

#### Show bgp all all convergence

RP/0/0/CPU0:R10# **show bgp all all convergence** Address Family: IPv4 Unicast

#### Converged.

All received routes in RIB, all neighbors updated. All neighbors have empty write queues.

Address Family: VPNv4 Unicast

#### Not converged.

Received routes may not be entered in RIB. One or more neighbors may need updating. Not converged – implies that there are BGP neighbors that for which the replication has not completed yet

# Troubleshooting BGP Convergence – IOS XR

#### **Verifying Performance Statistics**

```
'0/CPU0:R10#sh bgp ipv4 uni update-gr 0.2 performance-statistics
Update group for IPv4 Unicast, index 0.2:
                                                   Verify the time spent in
  <snip>
                                                  generating and replicated
 Messages formatted: 0, replicated: 0
                                                      the updates
 All neighbors are assigned to sub-group(s)
    Neighbors in sub-group: 0.1, Filter-Groups
     Neighbors in filter-group: 0.1(RT num:
      10.1.102.2 10.1.103.2 10.1.104
                                                 10.1.105.2
  Updates generated for 0 prefixes in 10/2alls(best-external:0)
              (time spent: 10.000 secs)
<snip>
```

# **Troubleshooting Route Filtering**

- Troubleshooting Missing Routes
- Troubleshooting Unexpected Routes
- Troubleshooting using Regex
- Troubleshooting Stale Routes

# Missing Routes / Stale Routes

### What does it mean?

- Missing Routes
  - · The remote peer has not received the route
  - Possible Problem
    - Either speaker didn't advertise the routes or the remote peer didn't receive or process the BGP update
    - Inbound / Outbound Route-maps (Filtering)
- Stale Routes
  - A route present in the BGP table learnt from remote peer but not present on the remote peer BGP table
  - Possible Problem
    - Either remote speaker didn't advertise the withdraw or the local device didn't process the withdraw
    - EOR received

## Missing Routes RPL in IOS XR

- IOS and NX-OS by default install routes in the BGP table for prefixes learnt from eBGP peers
- IOS XR requires a mandatory RPL policy to have them installed in BGP table.
  - The RPL can permit all routes or conditional routes

```
route-policy Inbound-ROUTES
if destination in Al-Prefix-Set then
    pass
else
    drop
endif
end-policy
router bgp 65530
neighbor-group IGW
    remote-as 65530
address-family ipv4 unicast
route-policy Inbound-ROUTES in
```

# **Missing Routes**

#### BGP not in read-write mode

- May not see the routes in BGP table, incase BGP remains in read-only mode
  - To have the BGP routes installed, BGP should be in read-write mode
- On XR, use the below commands to verify BGP in read-write mode
  - Show bgp
  - Show bgp process performance-statistics detail
    - At the very bottom of this output, you will see the below lines, if the device entered the read-write mode

First neighbor established:	Jan 2	3 20:15:45
Entered DO_BESTPATH mode:	Jan 2	3 20:15:49
Entered DO_IMPORT mode:	Jan 2	3 20:15:49
Entered DO_RIBUPD mode:	Jan 2	3 20:15:49
Entered Normal mode:	Jan 2	3 20:15:49
Latest UPDATE sent:	Jan 2	3 20:18:39

# **Unexpected Routes**

**Route-Map Problem** 

```
route-map OSPF2BGP permit 10
match ip prefix-list FILTERv4
!
router bgp 100
address-family ipv4 unicast
redistribute ospf 1 route-map OSPF2BGP
```

· What is the outcome of the above redistribution ?

# **Unexpected Routes**

**Route-Map Problem** 

```
route-map OSPF2BGP permit 10
match ip prefix-list FILTERv4
route-map OSPF2BGP permit 20
match ipv6 prefix-list FILTERv6
!
router bgp 100
address-family ipv4 unicast
redistribute ospf 1 route-map OSPF2BGP
address-family ipv6 unicast
redistribute ospfv3 1 route-map OSPF2BGP
```

• What is the outcome of the above redistribution ?

# **Unexpected Routes**

#### **Route-Map Behavior**

- A route map processes routes or IP packets in a linear fashion, that is, starting from the lowest sequence number.
- If referred policies (for example, prefix lists) within a match statement of a routemap entry return either a no-match or a deny-match, Device fails the match statement and processes the next route-map entry.
- Without any match statement in a route-map entry, the permission (permit or deny) of the route-map entry decides the result for all the routes or packets.

# **Troubleshooting Filtering**

#### **Regex Query Modifiers**

Modifier	Description				
_ (Underscore)	Matches a space				
^ (Caret)	Indicates the start of the string				
\$ (Dollar Sign)	Indicates the end of the string				
[] (Brackets)	Matches a single character or nesting within a range				
- (Hyphen)	Indicates a range of numbers in brackets				
[^] (Caret in Brackets)	Excludes the characters listed in brackets				
() (Parentheses)	Used for nesting of search patterns				
(Pipe)	Provides 'or' functionality to the query				
. (Period)	Matches a single character, including a space				
* (Asterisk)	Matches zero or more characters or patterns				
+ (Plus Sign)	One or more instances of the character or pattern				
? (Question Mark)	Matches one or no instances of the character or pattern.

Symptoms and Possible Causes

- Symptoms
  - Stale Entry to BGP Peer
  - Traffic Black-Hole
  - Outage
- Possible Causes
  - BGP Slow Peer
  - · Sender didn't process the updates
  - · Receiver didn't process the update

ciscolive;

#### Example – Route on BGP Speaker

RP/0/RSP0/CPU0:RR2#show bgp ipv4 labeled-unicast 10.229.37.92 BGP routing table entry for 10.229.37.92/32 Local Label: 25528 Last Modified: Jan 13 10:20:52.424 for 11:45:15 Paths: (1 available, best #1) Path #1: Received by speaker 0 Advertised to update-groups (with more than one peer): 0.1 0.2 0.3 0.7 Local **10.229.34.128** (metric 5) from 192.168.53.9 (10.229.37.92) Received Label 26596 Origin IGP, metric 0, localpref 100, valid, internal, best, group-best Received Path ID 1, Local Path ID 0, version 301642 Community: 65080:109 Originator: 10.229.37.92, Cluster list: 0.0.254.56, 10.229.34.128

#### Example – Stale Entry on Receiving Router

Central-RR#show bgp ipv4 unicast 10.229.37.92 BGP routing table entry for 10.229.37.92/32, version 290518 BGP Bestpath: deterministic-med Paths: (3 available, best #2, table default) Refresh Epoch 1 Local, (Received from a RR-client) 10.229.34.128 (metric 116) from 10.229.34.128 (10.229.34.128) Origin IGP, metric 0, localpref 100, valid, internal, best2 Community: 65080:109 Originator: 10.229.37.92, Cluster list: 10.229.34.128 mpls labels in/out nolabel/26596 rx pathid: 0x1A, tx pathid: 0x1 Local, (Received from a RR-client) 10.229.37.2 (metric 113) from 10.229.37.2 (10.229.37.2) Origin IGP, metric 0, localpref 100, valid, internal, best Community: 65080:109 Originator: 10.229.37.92, Cluster list: 10.229.37.2 mpls labels in/out nolabel/27183 rx pathid: 0x7, tx pathid: 0x0

#### How to Troubleshoot?

- On IOS, its difficult to get to the root cause after the problem has occurred.
  - · Enable conditional debugs and wait for the issue to happen again
  - Reproduce the problem in lab environment (hard but not impossible)
- On IOS XR, use show bgp trace and bgp debugs to understand if the advertisement has been sent/received or not
  - Debug
- On NX-OS, use show bgp event-history events | errors to figure out if the prefix has been received / advertised or not

## Stale Routes or Missing Routes / Advertisements

#### **Conditional Debugs**

IOS-1#show access-list 99

Standard IP access list 99 permit 10.1.1.0 0.0.0.255

IOS-1#debug ip bgp 2.2.2.2 update 99

IOS-XR

```
route-policy DEBUG_BGP
if destination in BGP_PREFIX then
   pass
else
   drop
endif
end-policy
prefix-set BGP_PREFIX
   100.1.1.0/24
end-set
debug bgp update ipv4 unicast [in | out] route-policy DEBUG_BGP
```

# BGP Route Churn and Troubleshooting with BGP Table Version

#### Route Churn Symptom - High CPU?

Router#*show process cpu* CPU utilization for five seconds: 100%/0%; one minute: 99%; five minutes: 81% .... 139 6795740 1020252 6660 88.34% 91.63% 74.01% 0 **BGP Router** 

- Define "High"
  - Know what normal CPU utilization is for the router in question
  - · Is the CPU spiking due to "BGP Scanner" or is it constant?
- Look at the scenario
  - Is BGP going through "Initial Convergence"?
- If not then route churn is the usual culprit
  - Illegal recursive lookup or some other factor causes bestpath changes for the entire table

#### High CPU due to BGP Router

- How to identify route churn?
  - Do "sh ip bgp summary", note the table version
  - Wait 60 seconds
  - Do "sh ip bgp summary", compare the table version from 60 seconds ago
- You have 150k routes and see the table version increase by 300
  - This is probably normal route churn
  - Know how many bestpath changes you normally see per minute
- You have 150k routes and see the table version fluctuating by 20K 50k
  - This is bad and is the cause of your high CPU

Router#Show ip bgp all sum | in tab BGP table version is **936574954**, main routing table version 936574954 BGP table version is 429591477, main routing table version 429591477 Router#

Over 1800 prefixes flapped

< 4 seconds later

Router#Show ip bgp all sum | in tag BGP table version is **936576768**, m ... routing table version 936575068 BGP table version is 429591526, main routing table version 429591526 Router#

#### Router#show ip route | in 00:00:0

В	187.164.0.0 [200/0] via 218.185.80.140, 00:00:00
В	187.52.0.0 [200/0] via 218.185.80.140, 00:00:00
В	187.24.0.0 [200/0] via 218.185.80.140, 00:00:00
В	187.68.0.0 [200/0] via 218.185.80.140, 00:00:00
В	186.136.0.0 [200/0] via <b>218.185.80.140,</b> 00:00:00

#### Table Version Changes?

- What causes massive table version changes?
- Flapping peers
  - Hold-timer expiring?
  - Corrupt UPDATE?
- Route churn
  - Don't try to troubleshoot the entire BGP table at once
  - · Identify one prefix that is churning and troubleshoot that one prefix
  - Will likely fix the problem with the rest of the BGP table churn

#### Flapping Routes in BGP

- Figuring out flapping routes from routing table is easy (even in vrf)
  - Show ip route vrf \* | in 00:00:0|VRF
- How about identifying flapping routes on the VPNv4 Route Reflector?
  - Show bgp vpnv4 unicast all summary | in table
  - Use the table version as the marker in the below command to see the routes which flapped after the last command that was executed
  - Show bgp vpnv4 unicast all version [version-num | recent version-num]
  - Use the next-hop of the prefixes from the above command, to see why the prefixes are flapping

#### Flapping Routes in BGP

```
R1#show bgp ipv4 unicast version recent 6

                                                        5 200 i
Processed 3 prefixes, 4 paths
```

#### Which AFI?

- If there are too many updates coming onto the router, one way to identify it would be
  - Show ip traffic | section TCP
- Symptom TCP traffic increasing rapidly, but table version for IPv4 and VPNv4 AFI is only increasing by 200 or 300 or a smaller value
- Check for different AFI's enabled on the router and checking for the table version changes in those AFI's
  - Especially IPv6 or VPNv6 as those can have more impact with fewer prefixes flapping

## Embedded Event Manager (EEM)

- · Serves as a powerful tool for high CPU troubleshooting
- Triggered based on event and thresholds
- · Multiple actions can be set based on events

event manager applet HIGHCPU event snmp oid "1.3.6.1.4.1.9.9.109.1.1.1.1.3.1" get-type exact entry-op gt entry-val "90" exit-op lt exit-val "70" poll-interval 5 maxrun 200 action 1.0 syslog msg "START of TAC-EEM: High CPU" action 1.1 cli command "show clock" action 1.3 cli command "show ip bgp all summary | append disk0:proc\_CPU" action 2.0 cli command "sh clock | append disk0:proc\_CPU" action 2.1 cli command "show process cpu sorted | append disk0:proc\_CPU" action 2.2 cli command "show proc cpu history | append disk0:proc\_CPU" action 2.3 cli command " show ip bgp all summary | append disk0:proc\_CPU" action 3.1 cli command "show log | append disk0:proc\_CPU" action 4.0 syslog msg "END of TAC-EEM: High CPU"

- RPM

Verifying BGP Configuration Parameters

- Sometimes we may require to verify some configuration parameters for BGP
- To verify the config / process wide parameters, use the command "show bgp process"
- · Includes the following:
  - BGP Router-ID
  - Confed ID or Cluster ID
  - Process and Memory state
  - # of configured peers and established peers
  - AFI information
    - Redistribution (if any)
      - Route-map
    - NHT Information

## Show bgp process

#### **Route Policy Manager**

- Route-map functionality is provided by a new process in DC-OS called Route Policy Manager (RPM)
- RPM handles route-maps, AS path access lists, community lists and prefix lists
- The route-maps are configured the same way as they are configured in Cisco IOS, but are managed by RPM
  - · If there are any issues seen with route-maps not functioning

#### **Route Policy Manager**

```
NX-1# show system internal sysmgr service name rpm
Service "rpm" ("rpm", 203):
    UUID = 0x131, PID = 5265, SAP = 348
    State: SRV_STATE_HANDSHAKED (entered at time Mon Jan 30 03:07:59
2017).
    Restart count: 1
    Time of last restart: Mon Aug 22 03:07:57 2016.
    The service never crashed since the last reboot.
    Tag = N/A
    Plugin ID: 1
```

#### **Route Policy Manager**

```
template peer-policy PP-Test1
send-community
route-map RM-Test1 out

#### **Route Policy Manager**

- Use RPM Event-history when troubleshooting any misbehavior of route policy / redistribution / missing routes / routes not learnt
- In case of issues, collect "show tech rpm"
- Use the below commands to troubleshoot RPM issues
  - Show system internal rpm event-history events (For RPM Events)
  - Show system internal rpm event-history errors (For errors with RPM)
  - Show system internal rpm event-history rsw (RPM Interaction with RPM software)
  - Show system internal rpm event-history msgs (RPM Message logs)
  - Show system internal rpm event-history trace (RPM Traces)

# **BGP** and Automation

- Automation using EEM Case Study
- ExaBGP

## Troubleshooting BGP with Automation

Case Study – Description

- Customer-A reported their eBGP peering to the MPLS ISP was not coming up
- MPLS ISP troubleshoot the issue and couldn't bring up the BGP for 2 hrs. Caused an major financial loss to Customer-A
- Switchover of the RP card on PE router restored the services

#### Troubleshooting BGP with Automation Case Study - Symptoms

- No IP reachability between PE and CE
- Packets wedged in the interface input-queue and the Interface
- The issue was caused by a DoS attack due to NTP

```
event manager applet Temp-Workaround auth bypass
event timer watchdog time 600 maxrun 600

action 055 end
```

- Python implementation of BGP The BGP swiss army knife of networking
  - https://github.com/Exa-Networks/exabgp/
- Installable on your laptop / pc
- Allows users to connect to a real or virtual router and advertise routes, simulate routes flapping
- Have support for multiple AFI/SAFI including ASN4, IPv6, MPLS, VPLS, Flow, Graceful Restart, Enhanced Route Refresh, AIGP, etc
- Can serve handy for Internal testing, learning and pre-deployment simulations

```
test:~ test$ cat conf.ini
neighbor 172.16.2.1 {
    router-id 172.16.2.1;
    local-address 172.16.2.2;
    local-as 65000;
    peer-as 65000;
```

```
# Our local update-source
# Our local AS
# Peer's AS}
```

<pre>\$ exabgp ./conf.ini</pre>	
! Output omitted for brevity	
04:31:19   27403   welcome	Thank you for using ExaBGP
04:31:19   27403   version	4.0.5
04:31:19   27403   configuration	<pre>  performing reload of exabgp 4.0.2-1c737d99</pre>
04:31:19   27403   reactor	loaded new configuration successfully
04:31:19   27403   reactor	connected to peer-1 with outgoing-1 172.16.2.1-
172.16.2.2
